Etiologia

É o fator de risco mais importante. A maioria dos diagnósticos ocorre acima dos 65 anos

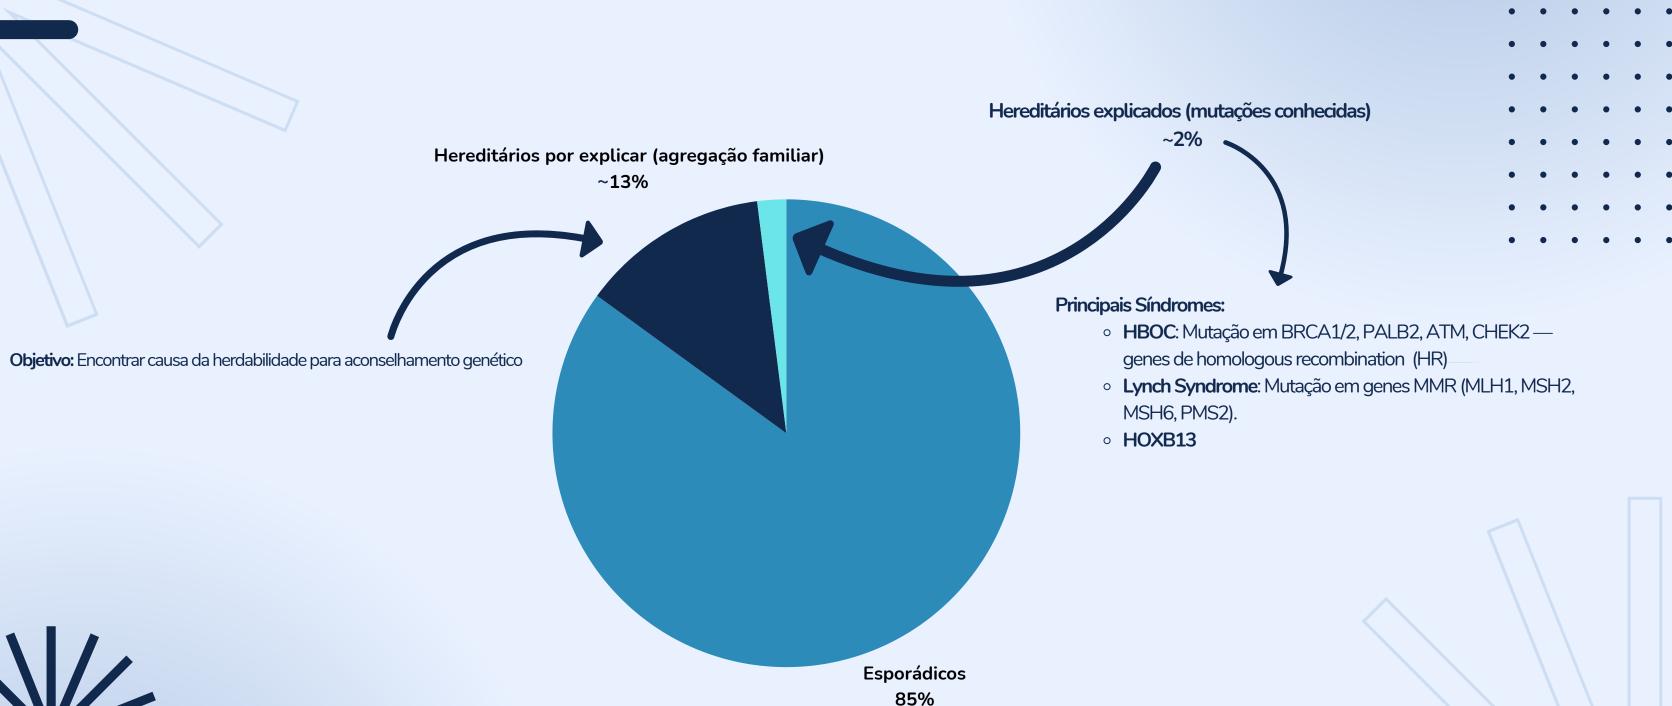

Critérios de Johns Hopkins: ≥3 familiares de 1º grau afetados, ≥3 gerações sucessivas, ou ≥2 casos com diagnóstico <56 anos.

Homens afrodescendentes têm maior risco de desenvolver e de apresentar formas mais agressivas da doença.

Síndromes hereditárias podem aumentar o risco em 40% a 50%

Outro fatores como dieta, hábitos tabagistas, obesidade, e sedentarismo foram confirmados como fatores de peso tanto na incidência como na mortalidade

Causas Genéticas

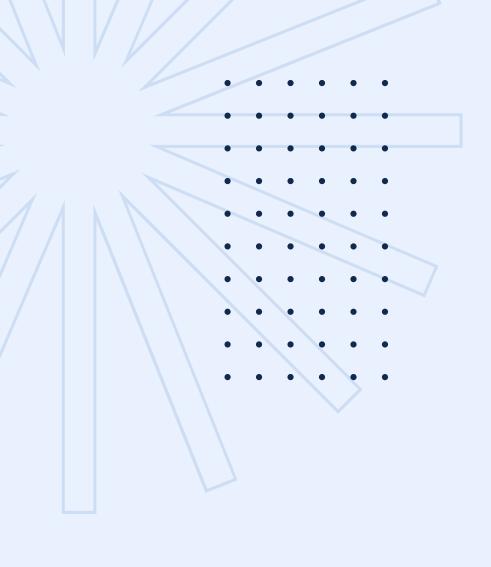

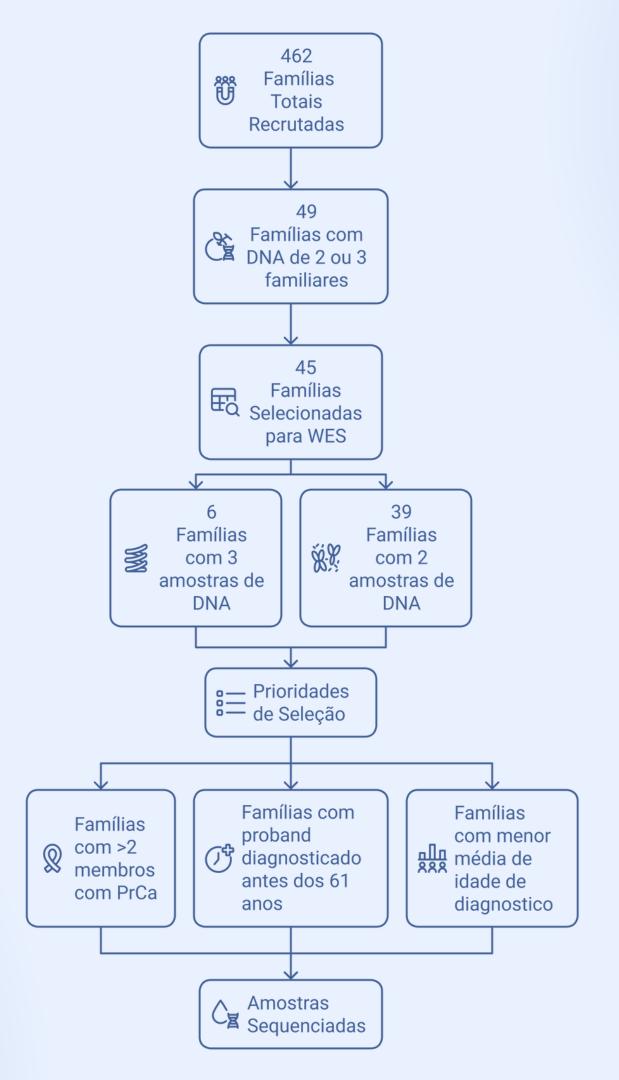

Kafka M, Surcel C, Heidegger I. Recent Insights on Genetic Testing in Primary Prostate Cancer. Mol Diagra Ther. 2021;25:425–38.

Nicolosi P, Ledet E, Yang S, Michalski S, Freschi B, O'Leary E, et al. Prevalence of Germline Variants in Prostate Cancer and Implications for Current Genetic Testing Guidelines. JAMA Oncol. 2019;5(4):523–8.

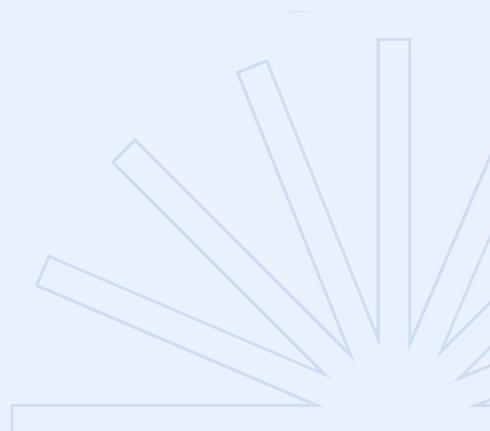

Das S, Salami SS, Spratt DE, Kaffenberger SD, Jacobs MF, Morgan TM. Bringing Prostate Cancer Germline Genetics into Clinical Practice. J Urol. 2019;202(2):223–30.

Critérios de seleção

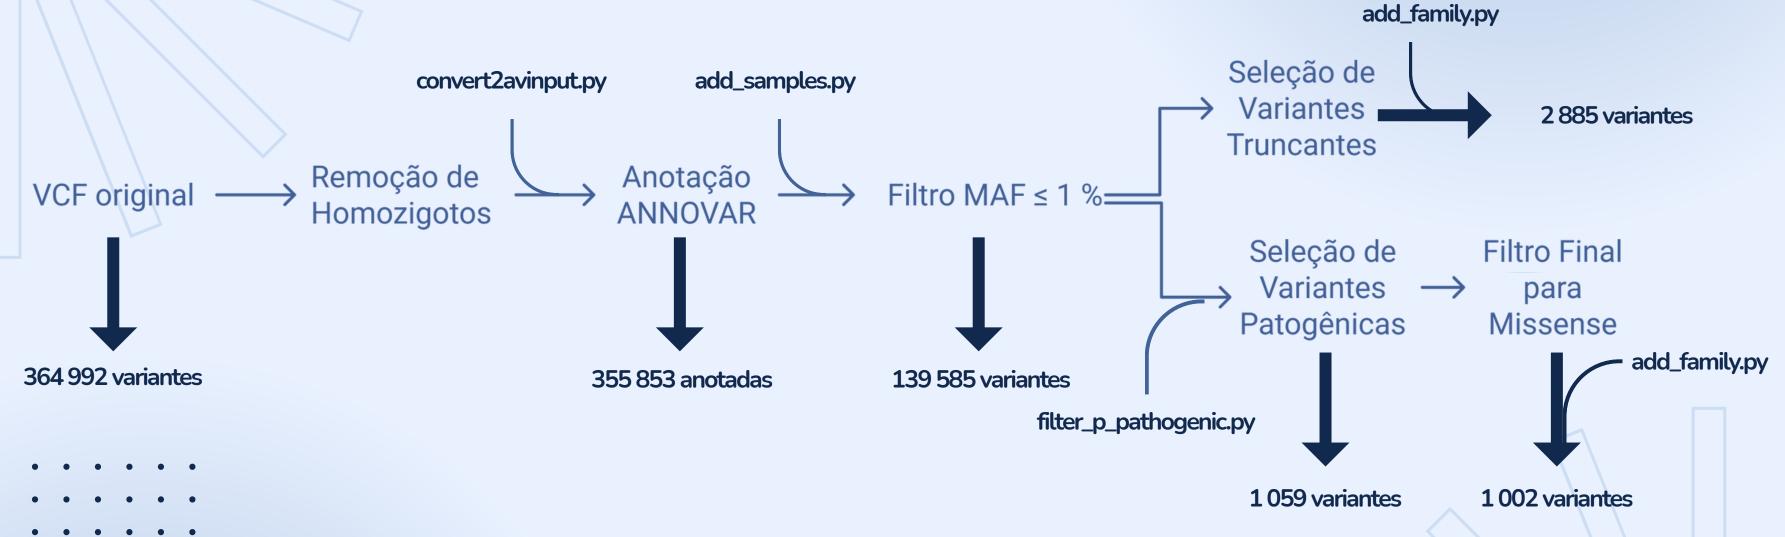

Data workflow

Scripts:

- convert2avinput.py Normalização de variantes (VCF → AVINPUT)
- add_samples.py Adicionar coluna "Samples" ao CSV anotado
- filter_p_pathogenic.py Filtrar variantes potencialmente patogénicas
- add_family.py Adicionar coluna "Family"

Analise em R MAFtools
